

ABSTRACT

EFFICIENT RECORDING OF OBJECT CAROUSELS

5 A transmission system comprises a transmitter (10) and at least one
receiver (14) configured to receive signals transmitted therefrom. Carousel-
forming data file and directory objects are sent in cycles, with predetermined
groups of file and directory objects being formed into respective modules at the
transmitter, suitably according to MPEG-2 DSM-CC protocols. Each of the
10 modules is transmitted as a whole, and the receiver is arranged to record
received file data and directory objects under a predetermined grouping
formulation, at elementary stream or module level.
